Falkirk Council

What happens to your recyclables?

Falkirk Council

Batteries (car)

are sold to a local scrap metal merchant. Batteries are then broken down into their constituent materials lead, plastic and battery acid, all of which are recycled.

Batteries (domestic)

are broken down industrially into their constituent parts for recycling.

Bicycles (currently Kinneil Kerse only)

are collected by a local community enterprise company, refurbished and re-sold locally.

Books

are resold in local charity shops.

Cans (steel, aluminium and aerosol)

are recycled into new steel and aluminium cans.

Cardboard

is sent to a local Materials Recycling Facility (MRF) where it is processed for recycling.

Garden Waste

is shredded and composted at Kinneil Kerse. The completed compost is provided free of charge to Falkirk Council residents as a soil improver and is also used by Falkirk Council Grounds Maintenance Service.

Gas Cylinders

are collected and returned to the gas supply companies. Suitable containers are reused while any damaged cylinders are recycled as scrap metal.

Glass (colour segregated)

is remanufactured locally into new bottles and jars.

Electrical Items

are collected under a scheme funded by the manufacturers to be recycled into new goods.

Mattresses and divan bed bases

are collected and broken down into their constituent parts, flame retardant cloth, cotton wadding, wood and steel all of which can be recycled.

Oil (engine)

is filtered and cleaned to be used as commercial heating oil.

Paper

is sent to a local Materials Recycling Facility (MRF) where it is processed for recycling.

Plastic bottles

are sent to a local Materials Recycling Facility (MRF) where it is processed for recycling.

Rubble

is screened and crushed on site to produce a recycled hardcore for use in construction projects, including the expansion of both Kinneil and Roughmote Recycling Centres and in the building of the Kinneil Composting Facility.

Scrap Metal

is sold to a local scrap metal merchant to be sold on the metal markets, being smelted into new metal items.

Shoes, belts, handbags and soft toys

are sorted locally for sale on the market. Charities receive funding based on the tonnage of materials collected in the banks.

Soil

is moved onto the Kinneil Kerse Landfill Site as a restoration material.

Textiles

are sorted locally for sale on to the market. Quality clothes are reused while poorer quality materials are made into industrial wipes or shredded for use as stuffings. Charities receive funding based on the tonnage of textiles collected in the banks.

Tyres

are collected and shredded to be used as an industrial fuel source.

Wood

is used in the manufacture of chipboard and as fuel for Combined Heat and Power Stations.

Reduce Reuse Recycle let's get it sorted
